

Rwanda has several energy resources and has so far developed clean energy generation projects with intention to boost the supply whilst alleviating socio-environmental impacts associated with energy production.

On Tuesday, German commercial storage system manufacturer, Tesvolt, has been commissioned to supply the world's largest decentralised off-grid storage system in the eastern province of Rwanda, East Africa.

production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil

With an official access rate of around 70% in 2023, of which some 20% comes from off-grid solutions such as solar home system and mini-grids, Rwanda has made major strides towards electrification.

The storage system will supply the irrigation project with clean and safe emergency power, also boosting yields in local agriculture. This should improve the living conditions of around 2,000 farmers, who currently live in extreme poverty.

As it was the first of its kind in Rwanda and in Africa in general, the plant was constructed as a pilot power plant and commissioned in 2016 to demonstrate the possibility of generating electricity from peat energy available in the region.

With an official access rate of around 70% in 2023, of which some 20% comes from off-grid solutions such as solar home system and mini-grids, Rwanda has made major strides towards electrification. African Energy takes a closer look at the country's energy mix and pipeline of power generation projects.
